Project Title: Virtual Reality

I'd like to build a multi-page website that summarizes the following topics, preferably one topic per page. There should be a menu bar at the top of the page that's in fixed position and scrolls with the page so that the user could always refer to it no matter which part of the page they're at.

- **Home Page:** This page would provide a general overview of what Virtual Reality is, then illustrate the experience this technology gives to its users.
- **History:** This should be a simple summary of how Virtual Reality becomes what it is today. It should not be wordy and very in-depth to the point of boring the audience.
- **Technology:** This page includes the technology used in creating Virtual Reality. Since this website does not assume its audience has any prior knowledge to VR, there should not be long explanations of each technology. Instead, I'd like there to be a list of software and hardware with images next to it.
- **Applications:** There are two sections of this page:
    - <u>Real life application:</u> This would include how VR is used in social sciences and psychology. You can include examples of softwares that are developed for these purposes.
    - <u>Entertainment:</u> This section would outline how VR is used in film and gaming industries.
